PERSONAL SUMMARY

Frontend engineer with 4+ years of experience building web apps end-to-end — from auth flows and complex form systems to video players and internal tooling. I care about writing clean, maintainable code and building interfaces that people actually enjoy using. Currently focused on video infrastructure and AI-powered tools at FuboTV.

SKILLS

- React and Angular
- Video web
- JavaScript and TypeScript
- State management (Redux and Recoil)
- HTML and CSS
- GraphQL integration
- React Native development
- Testing frameworks (Jest)
- Node.js and backend services
- Authentication protocols (SAML/OIDC)

AI-AUGMENTED DEVELOPMENT

- Actively use AI coding tools like **Claude Code**, **Cursor**, and **Gemini** as part of my daily frontend workflow — from scaffolding components and debugging tricky edge cases to writing tests and refactoring legacy code faster.
- Use **Figma Make (AI)** to go from a PRD straight to polished UI designs for internal tools, then iterate on them rapidly without waiting on a dedicated design cycle. This has significantly sped up how quickly we go from idea to working prototype.
- Set up an end-to-end automated bug-fix pipeline using **MCPs (Model Context Protocol servers)**: when a Slack message tags me with a bug, I give Claude the ticket number and it reads the issue, writes the fix, and raises a PR. I review the changes, approve, and the fix goes straight to QA — turning what used to be a 2–3 hour cycle into minutes.

EXPERIENCE

Software Engineer - Web

FuboTV

08/2024 to Current

Bengaluru, India

Video Curation & Annotation Tools (Moments Curation & VidAI Indexation)

- Built “VidAI Clip Master” — a React video annotation tool for reviewing AI-generated sports clips. Custom **Video.js player** with offset and trimmer plugins streams specific segments from multi-hour HLS sources without loading the full file.
- Wrote time-series logic so annotators can extend clip boundaries by +/- 10s and adjust trim points visually, all without re-initializing the player or triggering DOM re-renders.
- Built the review UI with accordion grouping for shared segments, variable playback speeds (1x–4x), and optimistic updates — cut down the QA team’s annotation turnaround time.
- Hooked up synchronized transcripts with word-level highlighting and **Vertex AI** for auto-generating clip titles, which saved the team a lot of manual metadata work.
- Built a separate clip curation tool using **ShadCN UI** and Fubo’s internal **PlayerWeb** (Shaka Player) for authenticated playback, with drag-and-drop playlist management.
- Designed the end-to-end workflow: filter AI clips → verify in player → add to new or existing playlists.
- Designed a real-time telemetry system capturing 9 user interaction events (session lifecycle, publish, clip CRUD, trim, title edits, tag mutations) with **discriminated union TypeScript types**. Used **localStorage-persisted session state** to maintain context across refreshes, and implemented differential tag change detection for intermediate and league clips — firing add/remove events only on field additions/removals by comparing metadata snapshots across three update flows.
- Built an audit telemetry dashboard with color-coded episode tables navigating to per-episode event timelines rendered in accordion UI with type-specific detail views (clip manifests, edit history chains, tag diffs) and client-side summary cards. Currently extending with session-based analytics graphs for active time distribution and publish frequency to surface editor productivity insights.

VidAI Platform — Video Pipeline Orchestration Tool

- Built the entire frontend from scratch for VidAI Platform, an internal tool that lets the team configure and run video processing pipelines. Stack: **React (Vite)**, fetch-based API layer, SSO auth via internal SDK.
- Set up a shared component library on top of **ShadCN UI** with custom theming, used across all platform screens for a consistent look and feel.
- Designed multi-step forms for **Pod Templates** (with version management) and **Job Templates** (dynamic pod config) — the core building blocks of the pipeline system.
- Built two scheduling interfaces: an **Auto-Scheduler** (calendar UI + cron rules for upcoming shows) and a **Manual Scheduler** (program calendar for running jobs on past events).
- Created the **Jobs Dashboard** with filters, search, and group-by functionality. Used nested accordion tables so users can drill into individual pod statuses within each job.
- Added a “Visualize” screen using **Video.js** to preview video streams alongside generated metadata like thumbnails. Also built a global **timezone selector** (React Context + localStorage) so timestamps stay consistent app-wide.

Software Engineer II (Promoted from Intern & SE I)

02/2021 to 08/2024

Deloitte(Hashedin)

Gurgaon

- **Auth Migration (Broadcom):** Owned the final phase of migrating Broadcom’s apps from Okta to AuthHub — reconfigured SAML/OIDC flows and tenant secrets for both federated and non-federated users across multiple applications.
- **GenAI & Office Plugins:** Built the frontend for an AI-powered FAQ tool in React TS. Also created Excel and PowerPoint plugins that used GPT-4 (32k) to generate slide content and derive complex formulas automatically.
- **GraphQL Schema Editor:** Built a visual schema editor using **React Flow** and **Recoil** with 80%+ test coverage (Jest). Separately, built Angular components with PrimeNG for S3 uploads with ClamAV virus scanning baked in.
- **Internship:** Built an onboarding portal for HashedIn University with React and charting libraries — gave new hires interactive dashboards to track their progress.

EDUCATION

Bachelors of Technology: CSE

01/2021

Jaypee Institute of Information Technology

Noida

- GPA: 8.1/10
